Foundations of Computer Programming: Input, Output & Import

Learning objectives:

- Understand and Utilise the Input Function
- Apply the Print Function for Output
- Implement Formatted Output for Better Readability
- Import and Use External Python Modules
- Recognise Common Python Modules and Their Uses

Lesson exercise: Week 7

1. Use the print () function to display the $$ separator between each string.

   Expected Output:

   My$$Name$$Is$$King

2. Write a program to take three names as input from a user in the single input() function call and Expected Output:

   Enter three Names: Ali Syed Tom
   Name1: Ali
   Name2: Syed
   Name3: Tom

3. Display float number (5.26459884) with 2 decimal places using print ().

4. Write a program to use f-strings method to format the following three variables as per the expected output

   year = 2023
   quantity = 3
   price = 450

   Expected Output:

   I have bought 3 footballs for 450.00 £, in the year 2023.

5. Get the first character from the following sentence: I have bought 3 footballs for 450.00 £, in the year 2023.

6. Get the length of the following sentence: I have bought 3 footballs.

7. Get the current date using today ().

8. Generate a random number between 1 and 100.

9. Write a program to take two numbers as input from a user and generate a random number between those two numbers.

10. Write a program to take two numbers as input from a user and program should add those two numbers and display.
